

Per-request Contracts for Web Services Transactions

Mr David Paul, A/Prof Frans Henskens, Dr Michael Hannaford

Distributed Computing Research Group School of Electrical Engineering and Computer Science University of Newcastle, Australia Outline

- Traditional Transactions
- Transactions for the Web Services environment
- Problems and Deficiencies
- Example Scenario
- Experimental Design
- Results
- Conclusion

Traditional Transactions

- Combine multiple actions into a logically single action
- Enforce ACID properties
 - Atomicity
 - Consistency
 - Isolation
 - Durability
- Designed for traditional systems
 - Single controlling authority
 - Short running time

Web Services Transactions

- Transaction Internet Protocol
 - Move traditional transactions to the Web environment
- Semantic Atomicity
 - Remove strict need for atomicity/isolation
 - Instead only require end result to be atomic
- Tentative Hold Protocol
 - Allow multiple holds on resources
 - Notify if/when resources become unavailable

Advanced Techniques

- Possible to avoid problems with isolation
 - Alrifai et al., 2006
 - Choi et al., 2005
- Possible to combine various different strategies
 - Limthanmaphon and Zhang, 2004
 - Fauvet et al., 2005
 - Mikalsen et al., 2002

6

- Enforcing isolation is still costly
- Providers must agree on a certain subset of possible reductions
 - Many possible reductions unable to be used
 - Should be able to decide without regard to other providers
- Providers must always offer the same level of transaction support for a given action
 - Should be able to dynamically change based on current conditions

- Three providers offering a competing service
 - Clients will use only one of these providers in their transaction
- Service offers clients a finite number of resources
 - Could be hotel room reservations, physical objects, etc
- Each provider offers an identical service except for level of transaction support provided
 - ie price, speed of delivery, etc. are not factors

Example Scenario

Provider Support

- Each provider offers either:
 - Semantic atomicity
 - Resources are booked when client first requests them. Client can later cancel the booking without a penalty.
 - Tentative holds
 - Resources are reserved when client first requests them. They
 are not booked until a client specifically books them. Provider
 cancels reservations if another client books the requested
 resources. Clients cannot cancel bookings without penalty.
 - Variable support
 - Provider offers semantic atomicity when resources are plentiful, but switches to tentative hold when a threshold is reached.

Example Scenario

Client Actions

- Client finds suitable provider
 - If none exist, transaction fails without penalty
- Next step depends on level of transactional support offered:
 - Semantic atomicity
 - In worst case, transaction fails without penalty
 - Tentative hold
 - In worst case, transaction fails with penalty

Experiment Design

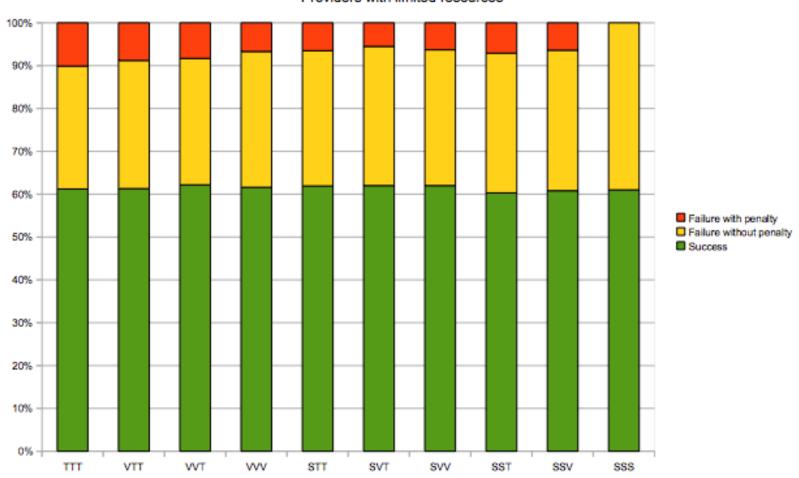

- Simulator monitors all messages being sent
- 1000 client transactions randomly generated
 - 80% prefer semantic atomicity, 10% require semantic atomicity, 10% willing to use any level of transaction support
- Runs with each combination of transactional support possible for the three providers
 - Semantic Atomicity, Tentative Hold, Alternating
- Three experimental setups
 - Clients requesting between 1 and 10 resources
 - Providers with limited resources
 - Providers with sufficient resources
 - Half of clients requesting 50 resources

11

Outcome of transactions

Providers with limited resources

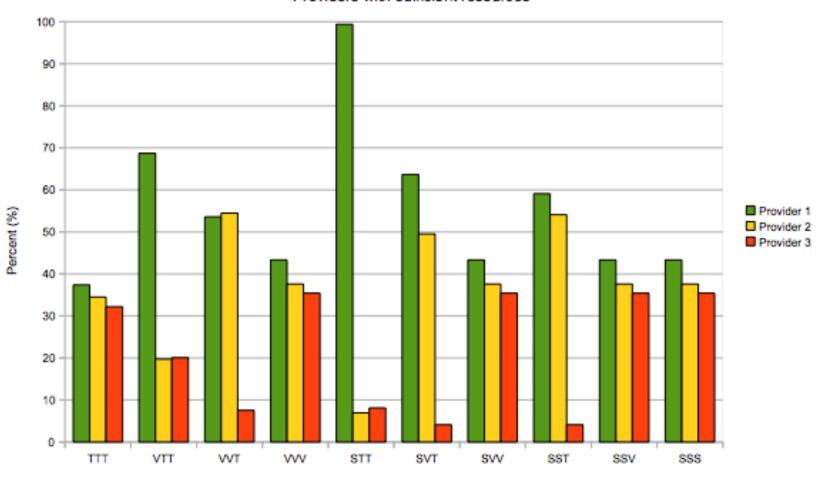

Transaction level offered by providers. T=Tentative scheme, V=Variable scheme, S=Semantic scheme

Provider utility

Providers with sufficient resources

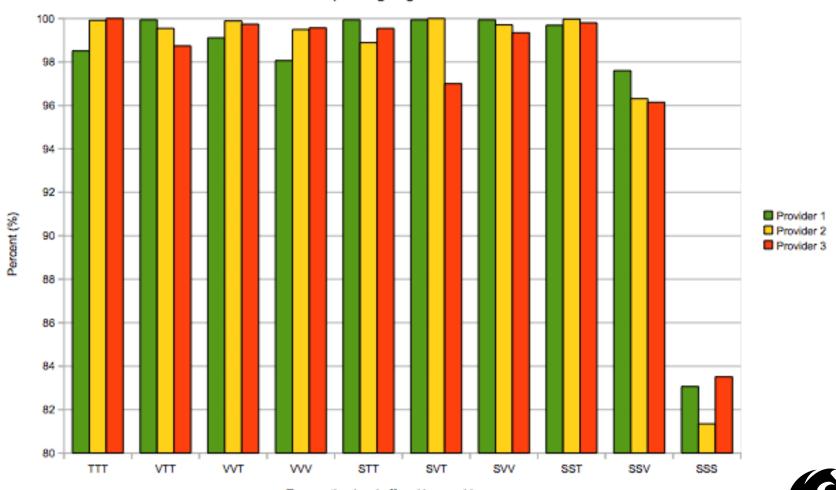

Transaction level offered by providers

Results - Clients requesting large amounts of resources

Provider utility

Transaction level offered by providers
A presentation for WEBIST'10 | www.newcastle.edu.au

- Transaction-like constructs are important in service-oriented environments
 - ACID often not the best choice
- Dynamically deciding on level of transactional support can be beneficial
 - For providers
 - For clients
- Determining what level to support/accept is an open problem
 - Providers want to maximise profit
 - Clients want an acceptable level of risk

DISCUSSION

Per-request Contracts for Web Services Transactions

Results

Limited Resources

Table 1: Results when providers have limited resources.

| Provider 1 | Provider 2 | Provider 3 | Clients (%) | | | | | | |
|------------|------------|------------|--------------|------------|----------|---------|---------|--|--|
| | | | Failure with | | | | | | |
| Protocol | Protocol | Protocol | Success | No Penalty | | Penalty | Any | | |
| | | | | penalty | on other | on this | penalty | | |
| | | | | | activity | service | | | |
| Tentative | Tentative | Tentative | 61.2 | 28.7 | 7.6 | 2.5 | 10.1 | | |
| Variable | Tentative | Tentative | 61.3 | 29.9 | 6.3 | 2.5 | 8.8 | | |
| Variable | Variable | Tentative | 62.2 | 29.5 | 5.7 | 2.6 | 8.3 | | |
| Variable | Variable | Variable | 61.6 | 31.7 | 3.6 | 3.1 | 6.7 | | |
| Semantic | Tentative | Tentative | 61.9 | 31.6 | 4.6 | 1.9 | 6.5 | | |
| Semantic | Variable | Tentative | 62.0 | 32.5 | 3.0 | 2.5 | 5.5 | | |
| Semantic | Variable | Variable | 62.0 | 31.7 | 3.1 | 3.2 | 6.3 | | |
| Semantic | Semantic | Tentative | 60.3 | 32.6 | 3.7 | 3.4 | 7.1 | | |
| Semantic | Semantic | Variable | 60.8 | 32.8 | 2.1 | 4.3 | 6.4 | | |
| Semantic | Semantic | Semantic | 61.0 | 39.0 | 0.0 | 0.0 | 0.0 | | |

Results

Sufficient Resources

Table 2: Results when providers have sufficient resources.

| Provider 1 | | Provider 2 | | Provider 3 | | Clients | | |
|------------|-------------|------------|------------|------------|-------------|-------------|-----------------------------|--------------------------|
| Protocol | Utility (%) | Protocol U | tility (%) | Protocol | Utility (%) | Success (%) | Failure with no penalty (%) | Failure with penalty (%) |
| Tentative | 37.37 | Tentative | 34.49 | Tentative | 32.17 | 72.6 | 18.8 | 8.6 |
| Variable | 68.89 | Tentative | 19.71 | Tentative | 20.06 | 76.6 | 18.0 | 5.4 |
| Variable | 53.57 | Variable | 54.46 | Tentative | 7.51 | 80.0 | 18.8 | 1.2 |
| Variable | 43.31 | Variable | 37.60 | Variable | 35.40 | 80.7 | 19.3 | 0.0 |
| Semantic | 99.40 | Tentative | 06.91 | Tentative | 8.11 | 80.0 | 19.2 | 0.8 |
| Semantic | 63.66 | Variable | 49.51 | Tentative | 4.11 | 80.7 | 18.8 | 0.5 |
| Semantic | 43.31 | Variable | 37.60 | Variable | 35.40 | 80.7 | 19.3 | 0.0 |
| Semantic | 59.09 | Semantic | 54.09 | Tentative | 4.11 | 80.7 | 18.8 | 0.5 |
| Semantic | 43.31 | Semantic | 37.60 | Variable | 35.40 | 80.7 | 19.3 | 0.0 |
| Semantic | 43.31 | Semantic | 37.60 | Semantic | 35.40 | 80.7 | 19.3 | 0.0 |

Clients requesting large amounts of resources

Table 3: Results when half of the clients request large amounts of resources.

| Provider 1 | | Provider 2 | | Provider 3 | | Clients | | |
|------------|-------------|------------|-------------|------------|-------------|-------------|-----------------------------|--------------------------|
| Protocol | Utility (%) | Protocol U | Jtility (%) | Protocol | Utility (%) | Success (%) | Failure with no penalty (%) | Failure with penalty (%) |
| Tentative | 98.51 | Tentative | 99.91 | Tentative | 100.00 | 46.5 | 32.6 | 20.9 |
| Variable | 99.94 | Tentative | 99.54 | Tentative | 98.74 | 45.0 | 36.3 | 18.7 |
| Variable | 99.11 | Variable | 99.89 | Tentative | 99.74 | 43.4 | 43.0 | 13.6 |
| Variable | 98.06 | Variable | 99.49 | Variable | 99.57 | 43.0 | 48.0 | 9.0 |
| Semantic | 99.94 | Tentative | 98.89 | Tentative | 99.54 | 44.9 | 41.6 | 13.5 |
| Semantic | 99.94 | Variable | 100.00 | Tentative | 97.00 | 44.8 | 45.9 | 9.3 |
| Semantic | 99.94 | Variable | 99.71 | Variable | 99.34 | 42.2 | 53.4 | 4.4 |
| Semantic | 99.69 | Semantic | 99.97 | Tentative | 99.80 | 41.3 | 51.5 | 7.2 |
| Semantic | 97.60 | Semantic | 96.31 | Variable | 96.14 | 39.7 | 57.6 | 2.7 |
| Semantic | 83.06 | Semantic | 81.34 | Semantic | 83.51 | 34.8 | 65.2 | 0.0 |
